Air traffic controllers typically monitor the trajectory of the aircraft in real-time, but can have difficulty accurately judging the distance that the aircraft must travel to the runway. Air traffic controllers are typically asked to judge the landing distance and estimate when the aircraft will arrive at the runway based on the current information. Even though the pilots may include the estimated length of runway in their calculations, their best estimate is the end of the runway. The United States Federal Aviation Administration (FAA) requires that aircraft land at least 150 feet (46 meters) from the end of the runway. Even if the aircraft lands on the runway only 40 feet (12 meters) from the end of the runway, if the runway is less than 150 feet (46 meters) in length, the FAA requires the aircraft to be positioned at least 10 feet (3 meters) off the end of the runway in order to make the approach safe. This requirement is particularly challenging when the runway is further away from the end of the runway than is 82157476af
